Solar Activity

Solar flare activity was very low during the week.

In order to view the activity of this week in more detail, we suggest to go to the following website from which all the daily (normal and difference) movies can be accessed: <http://proba2.oma.be/ssa>

This page also lists the recorded flaring events.

A weekly overview movie can be found [here](#) (SWAP week 497).

Details about some of this week's events can be found further below.

If any of the linked movies are unavailable they can be found in the P2SC movie repository [here](#)

Monday Sep 30

A patchy coronal hole crossed the central meridian on September 30. It is visible in the SWAP image above as a patchy dark region towards the south of the solar disk.

Find a movie of the event [here](#) (SWAP movie)

Tuesday Oct 01

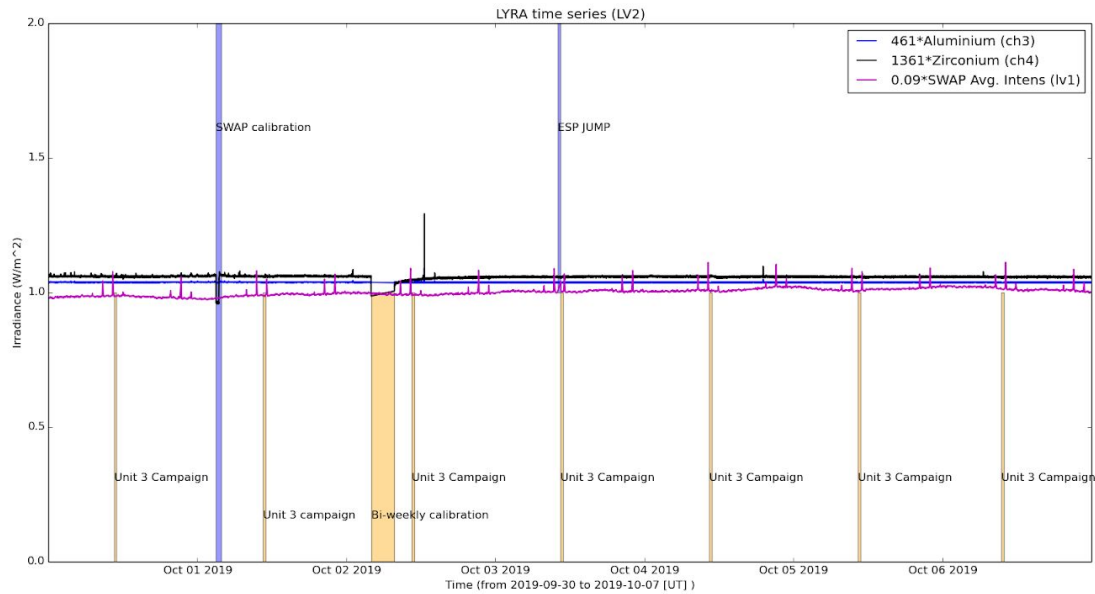

The only active region of the week is visible in the east part of the disk. It corresponds to the NOAA 2749 sunspot group which gave rise to a B1.6 class flare around 1:44 UT.

Find a movie of the event [here](#) (SWAP movie)

7. APPENDIX Solar Activity Definitions

In the science section we use the following solar activity standards.

The standard scale for solar activity is:

- very low (almost no flares, only B)
- low (a few C flares)
- moderate (many C flares and at least an M flare)
- high (several M flares and an X flare)
- very high (continuous background of C flares, numerous M flares, more than one X flare)
