Solar Activity

Solar flare activity fluctuated from very low to low during the week.

In order to view the activity of this week in more detail, we suggest to go to the following website from which all the daily (normal and difference) movies can be accessed: <https://proba2.oma.be/ssa>

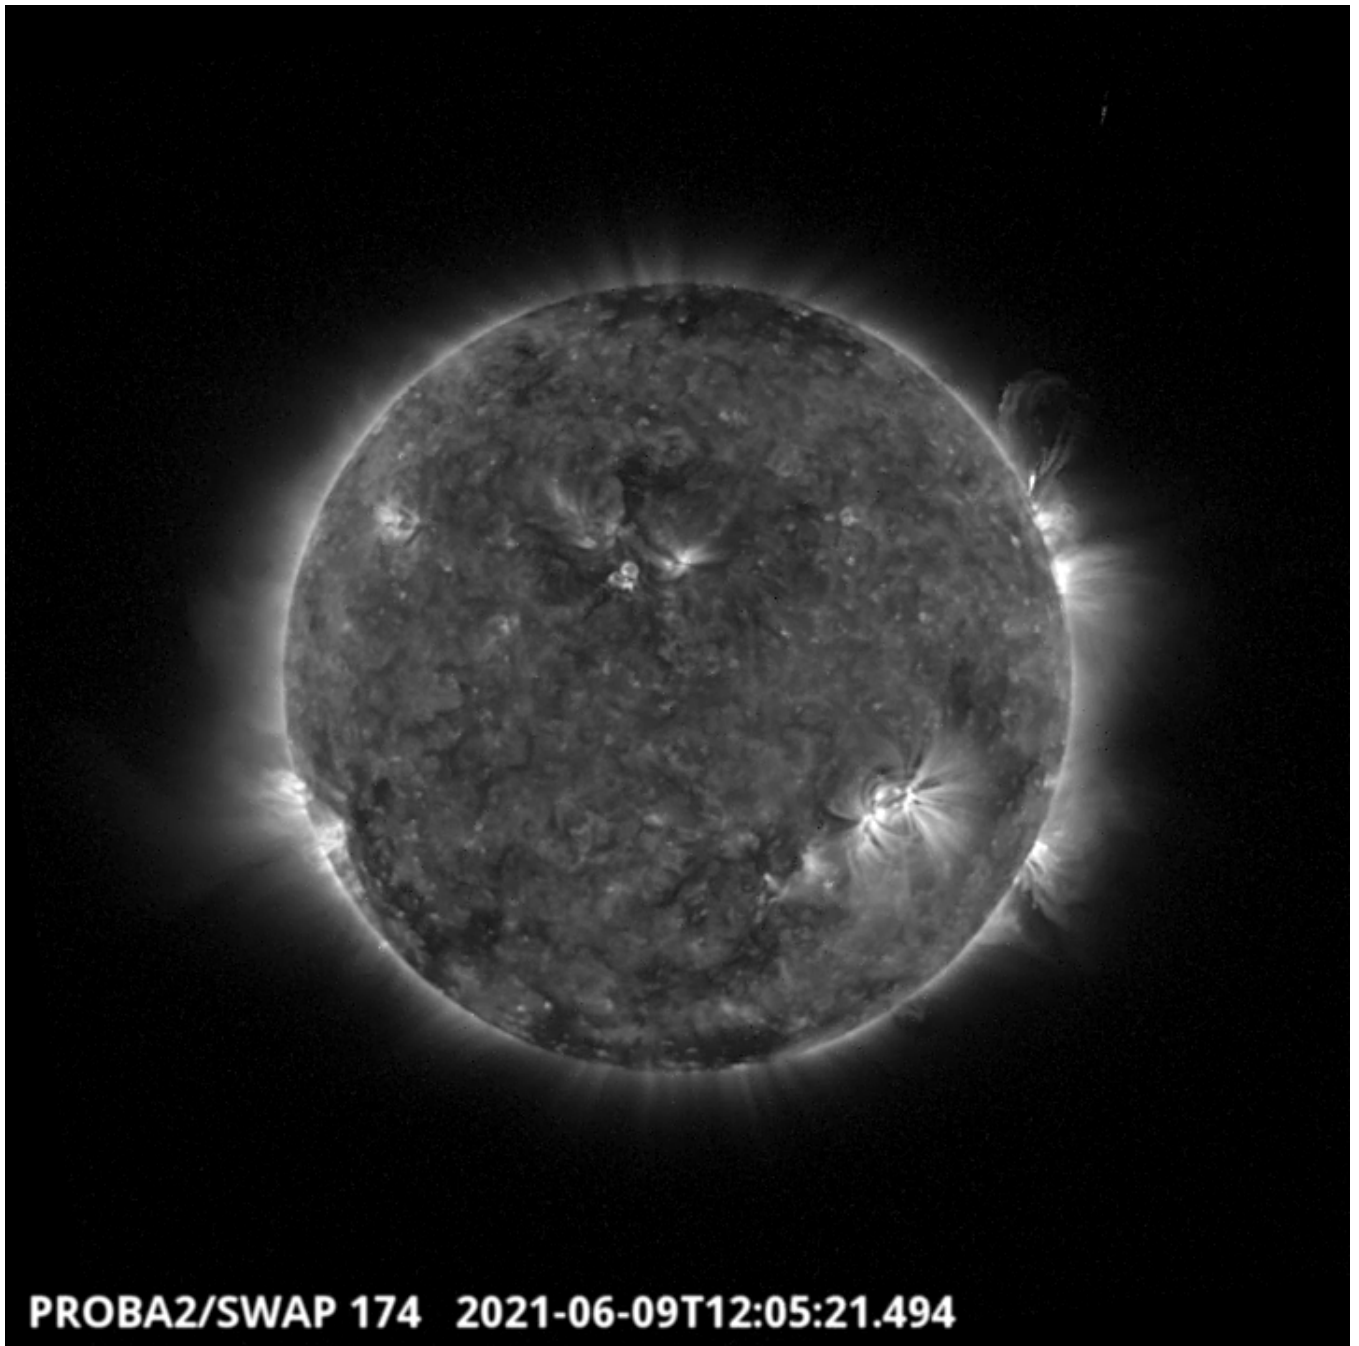

This page also lists the recorded flaring events.

A weekly overview movie can be found [here](#) (SWAP week 585).

Details about some of this week's events can be found further below.

If any of the linked movies are unavailable they can be found in the P2SC movie repository [here](#)

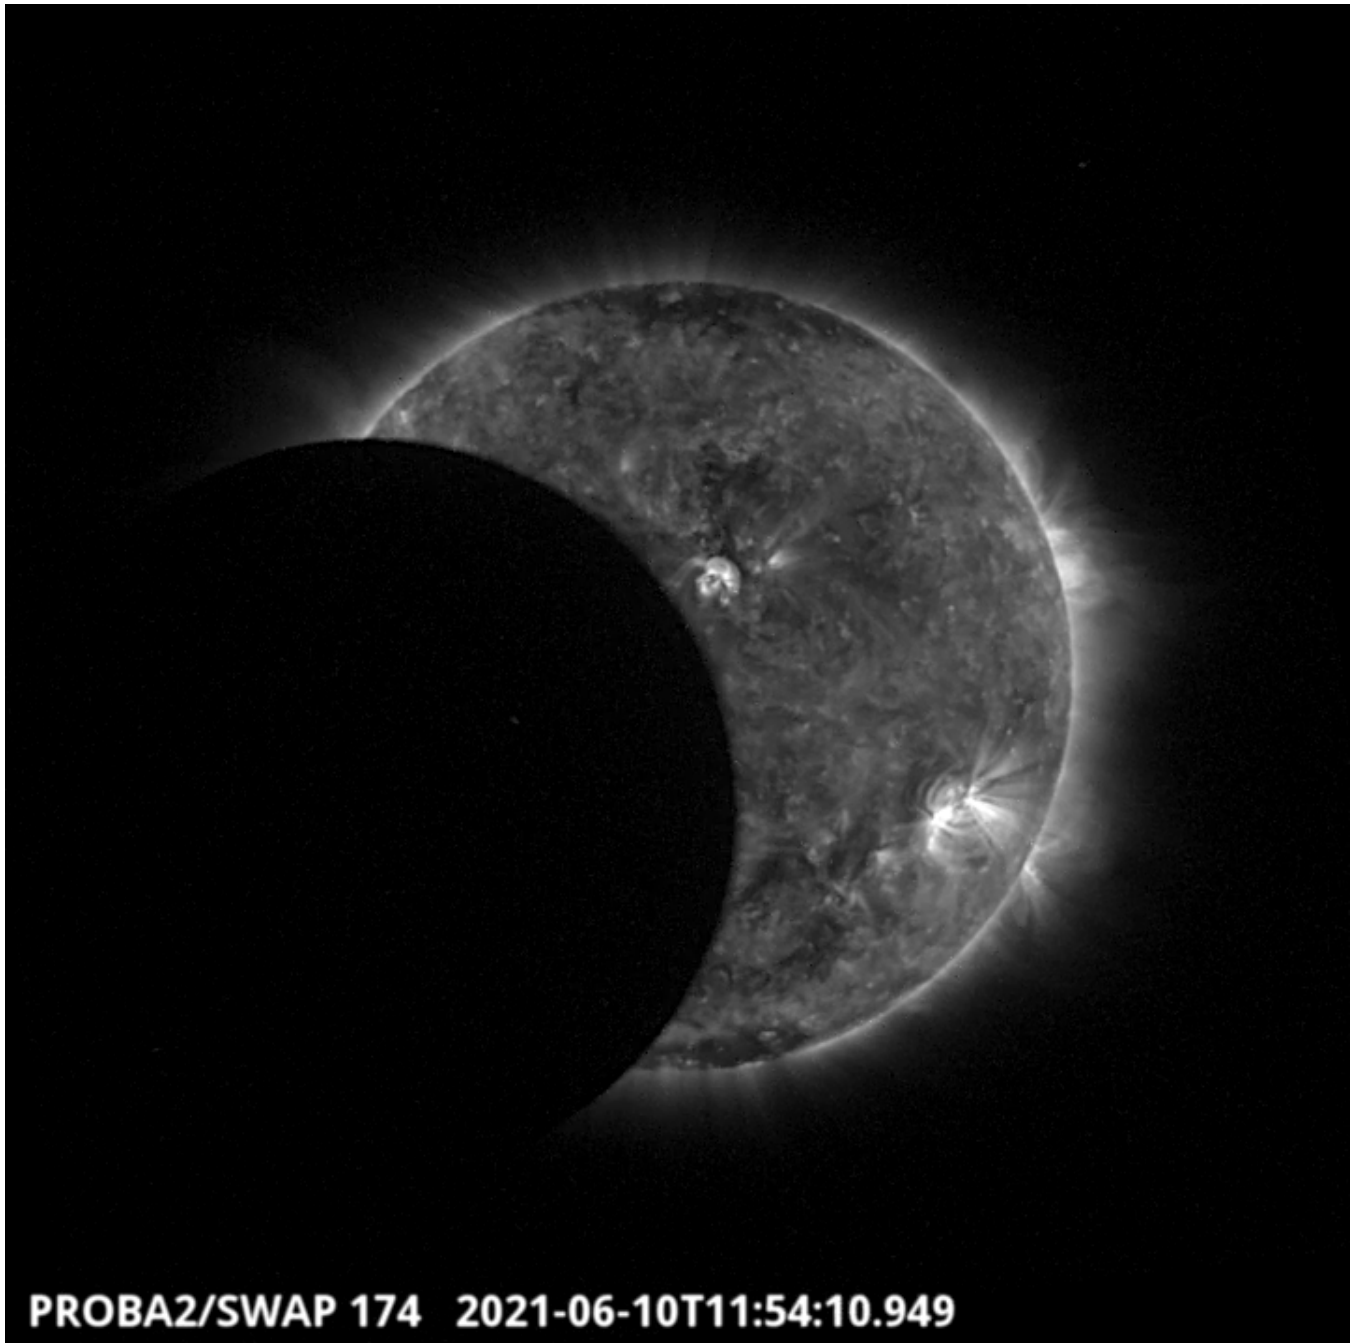

Wednesday Jun 09

Departing from the NOAA active region 2831 on the North-West part of the solar disk, a plume of plasma erupted and is visible on the SWAP image above around 12:05 UT.

Thursday Jun 10

A partial eclipse was observed by SWAP on June 10. The satellite transited three times in the Moon shadow. An eclipse challenge has been organized by the SWAP/LYRA team for the occasion.

7. APPENDIX Solar Activity Definitions

In the science section we use the following solar activity standards.

The standard scale for solar activity is:

- very low (almost no flares, only B)
- low (a few C flares)
- moderate (many C flares and at least an M flare)
- high (several M flares and an X flare)
- very high (continuous background of C flares, numerous M flares, more than one X flare)
