Solar & Space weather events

The level of solar activity[1] fluctuated between **low and moderate** this week.

Only M- and X-flares are mentioned, the most energetic one(s) per day are presented in **bold**:

	Monday 02 Jun	Tuesday 03 Jun	Wednesday 04 Jun	Thursday 05 Jun	Friday 06 Jun	Saturday 07 Jun	Sunday 08 Jun
Activity	moderate	moderate	moderate	low	low	low	low
Flares	**M1.1, M3.3**	**M1.4**	**M1.1**	-	-	-	-

[1] See appendix. All timings are given in UT.

Solar Activity

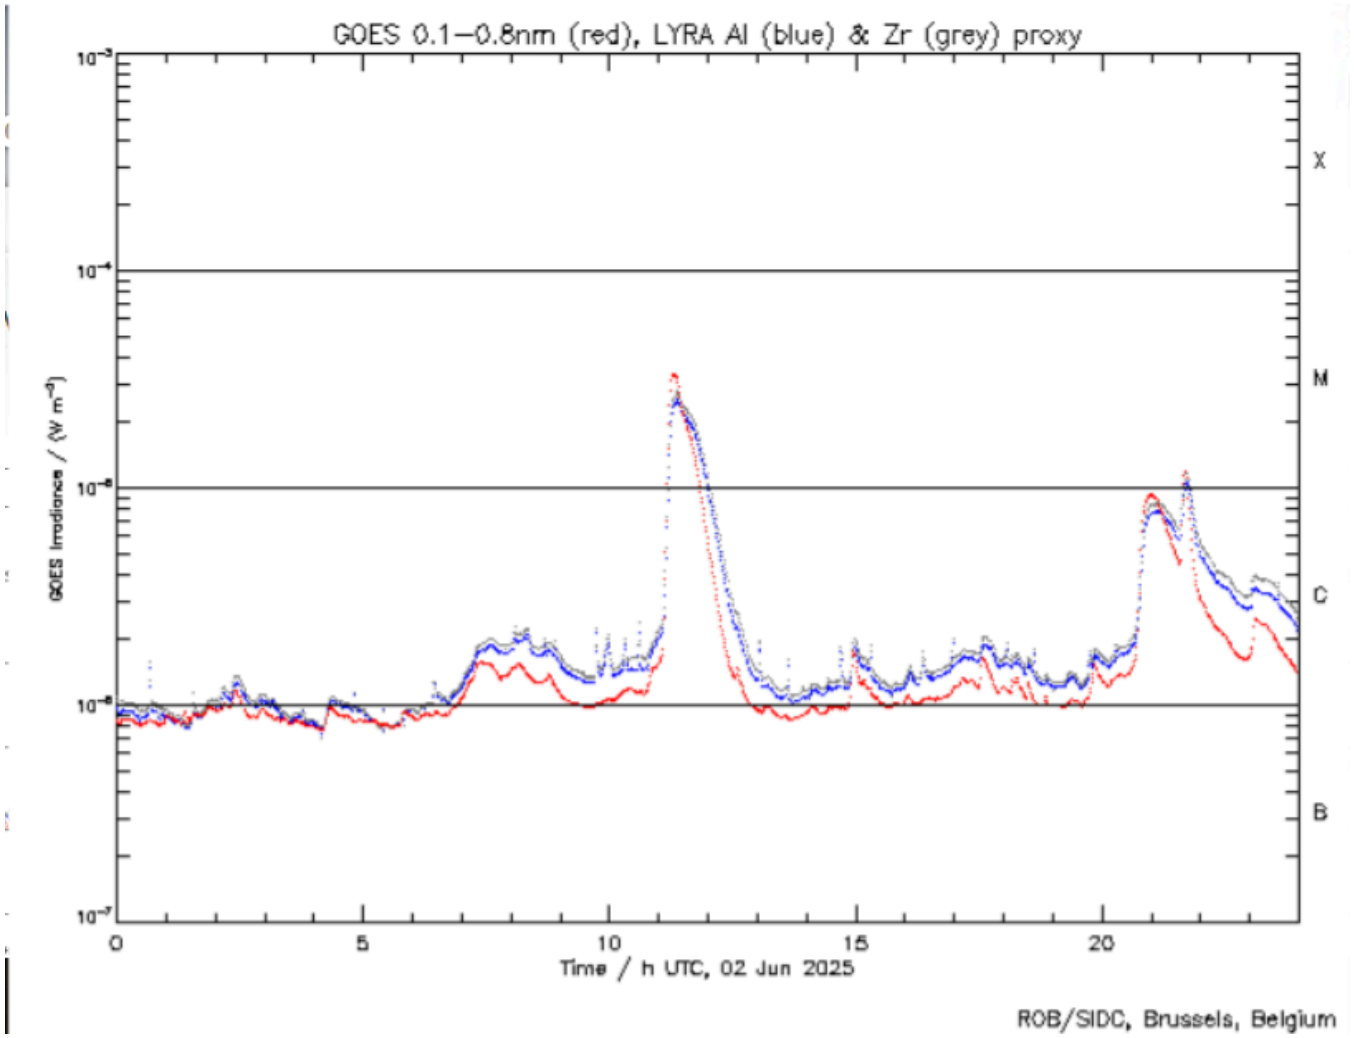
Solar flare activity fluctuated from low to moderate during the week.
In order to view the activity of this week in more detail, we suggest to go to the following website from which all the daily (normal and difference) movies can be accessed: https://proba2.oma.be/ssa
This page also lists the recorded flaring events.

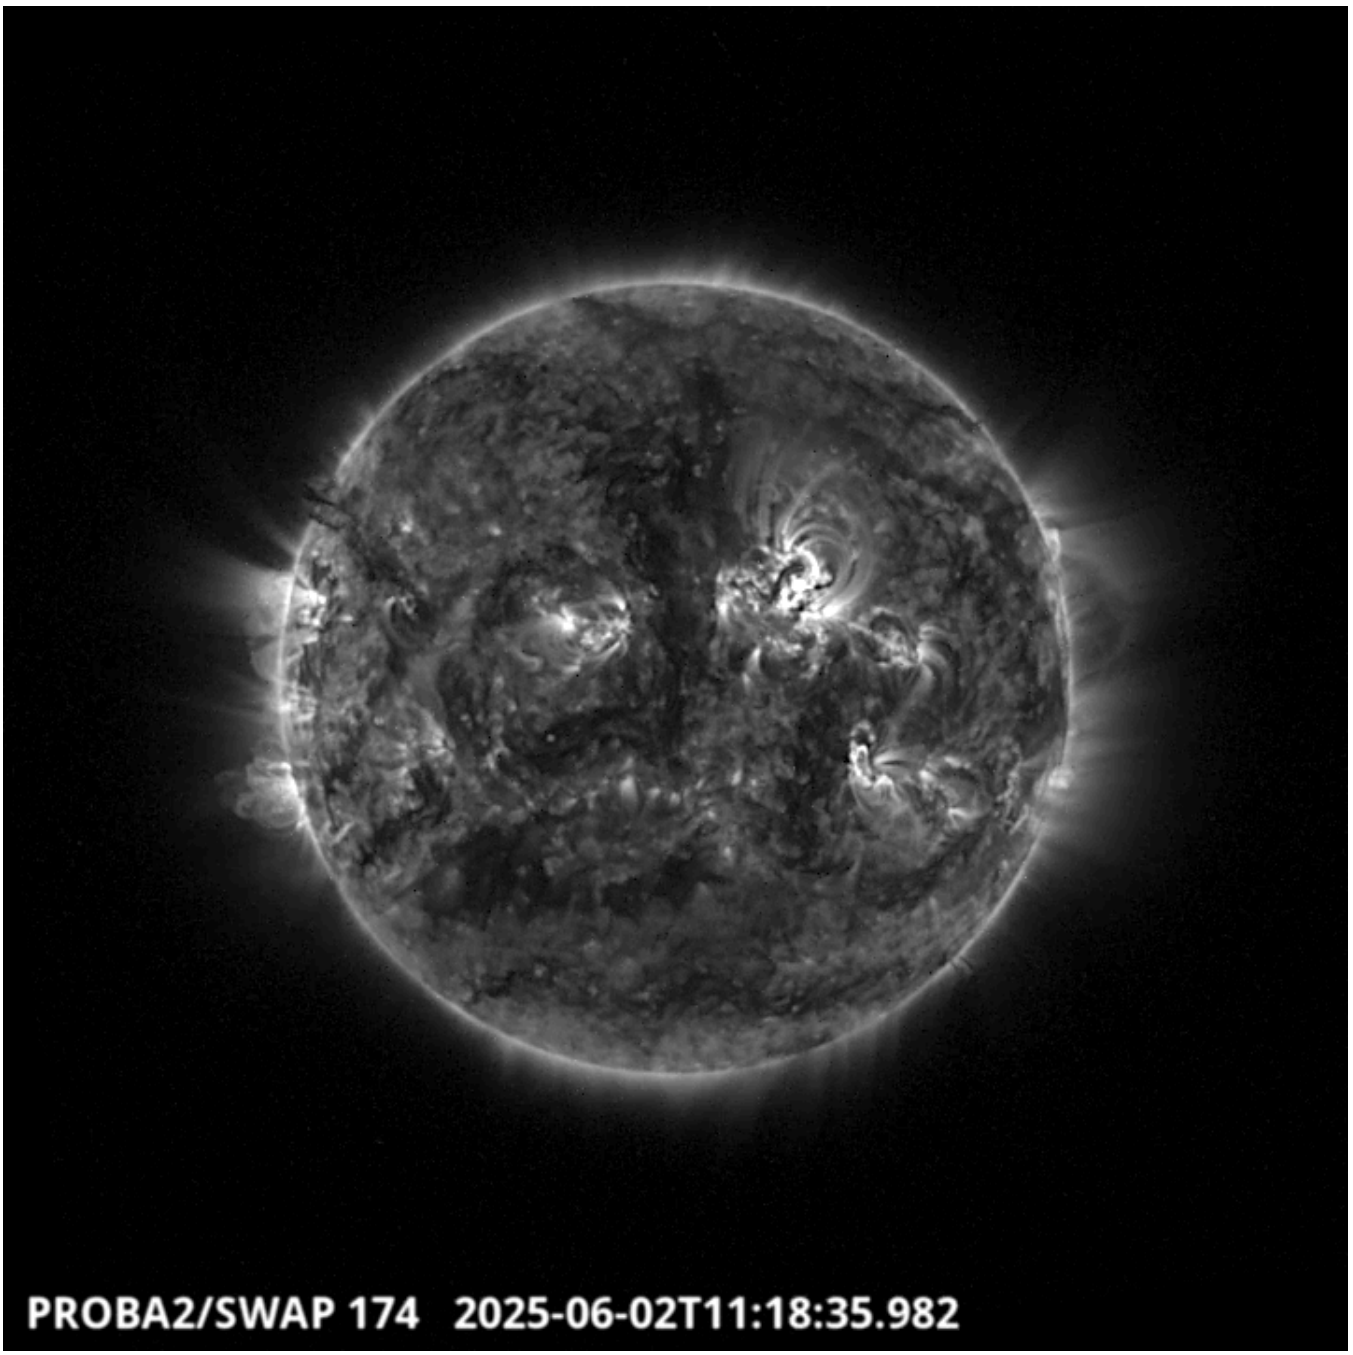
A weekly overview movie can be found here (SWAP week 793).

Details about some of this week's events can be found further below.

If any of the linked movies are unavailable they can be found in the P2SC movie repository here

Monday Jun 02





The largest flare of the week was an M3.3, peaking at 11:18 UTC. It was produced by the AR 4100 located in the North West part of the solar disk. It has been registered by LYRA(top panel) and SWAP (low panel).

Find the SWAP movie here.

An overview of the weekly LYRA & SWAP data is provided below:
The following curves are visible:

7. APPENDIX Solar Activity Definitions

In the science section we use the following solar activity standards.

The standard scale for solar activity is:
- very low (almost no flares, only B)
- low (a few C flares)
- moderate (many C flares and at least an M flare)
- high (several M flares and an X flare)
- very high (continuous background of C flares, numerous M flares, more than one X flare)
